THE GRAIN PROTECTION PROTOCOL

Storing grain on-farm can provide valuable marketing flexibility. But without a plan to protect grain quality from insect damage, storage-related losses can quietly erode profitability. The Grain Protection Protocol is a practical system designed to help producers maximize stored grain quality, volume and value. The key is taking the threat of insects seriously and acting before you have to.

Follow this simple guide each season to enact a strong, proactive Grain Protection Protocol.

PRE-HARVEST

Reduce Risk + Start Clean

Get started before insects do. Pretreating empty bin structures and surfaces helps prevent insect infestations before, during and after grain fill.

HARVEST

Protect at Load-in + Lock in Value

Ensure no insects get a free ride. Treat incoming harvested grain to remove insects at storage time and prevent infestations down the line.

STORAGE

Store With Confidence + Preserve Quality

Maximum in, maximum out. Consistently monitor grain over time and apply facility, perimeter* and equipment treatments throughout storage to preserve grain quality, consistency and volume.

LOAD-OUT + DELIVERY

Maximize Return + Cash In

You took the effort to protect it. Now inspect the results. Testing and inspections ensure your grain is clean and market-ready when you decide it's time to sell.

*Not for use in California

Continuously Monitor + Manage Site Maintain grain quality while reinforcing consistent seasonal protection practices.
